# Multi-Species Pest Risk Analysis of Climate Impacts on Field Crop Pests in Canada

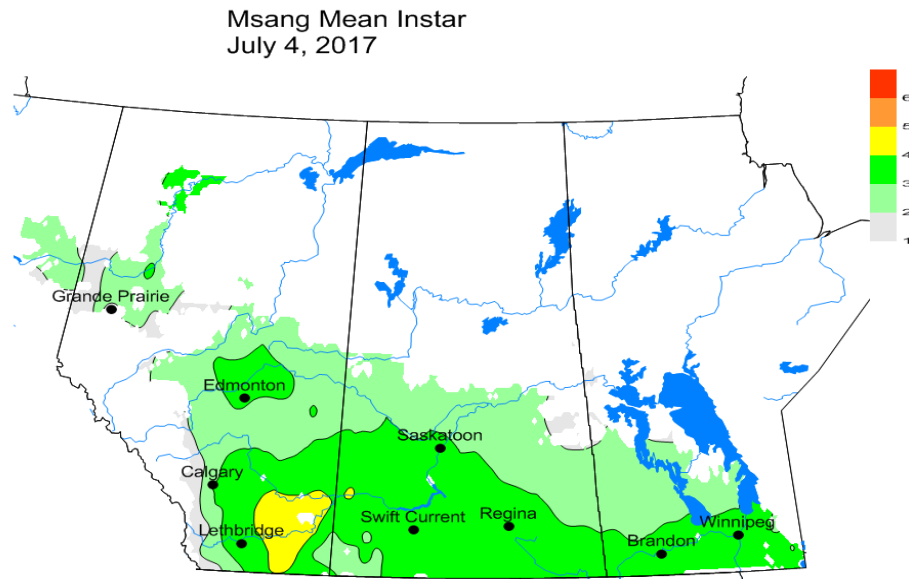

R. Weiss and O. Olfert

AAFC - Saskatoon Research and Development Centre

Canada 

# Considerations

- In agricultural ecosystems we often only consider one pest species at a time.
- Crop production decisions are based on three time frames. Pest risk analysis and decision support should permit analysis across these periods
  - Upcoming growing season
  - Within season
  - Long term (decades)
- Develop a modelling framework to address these issues.

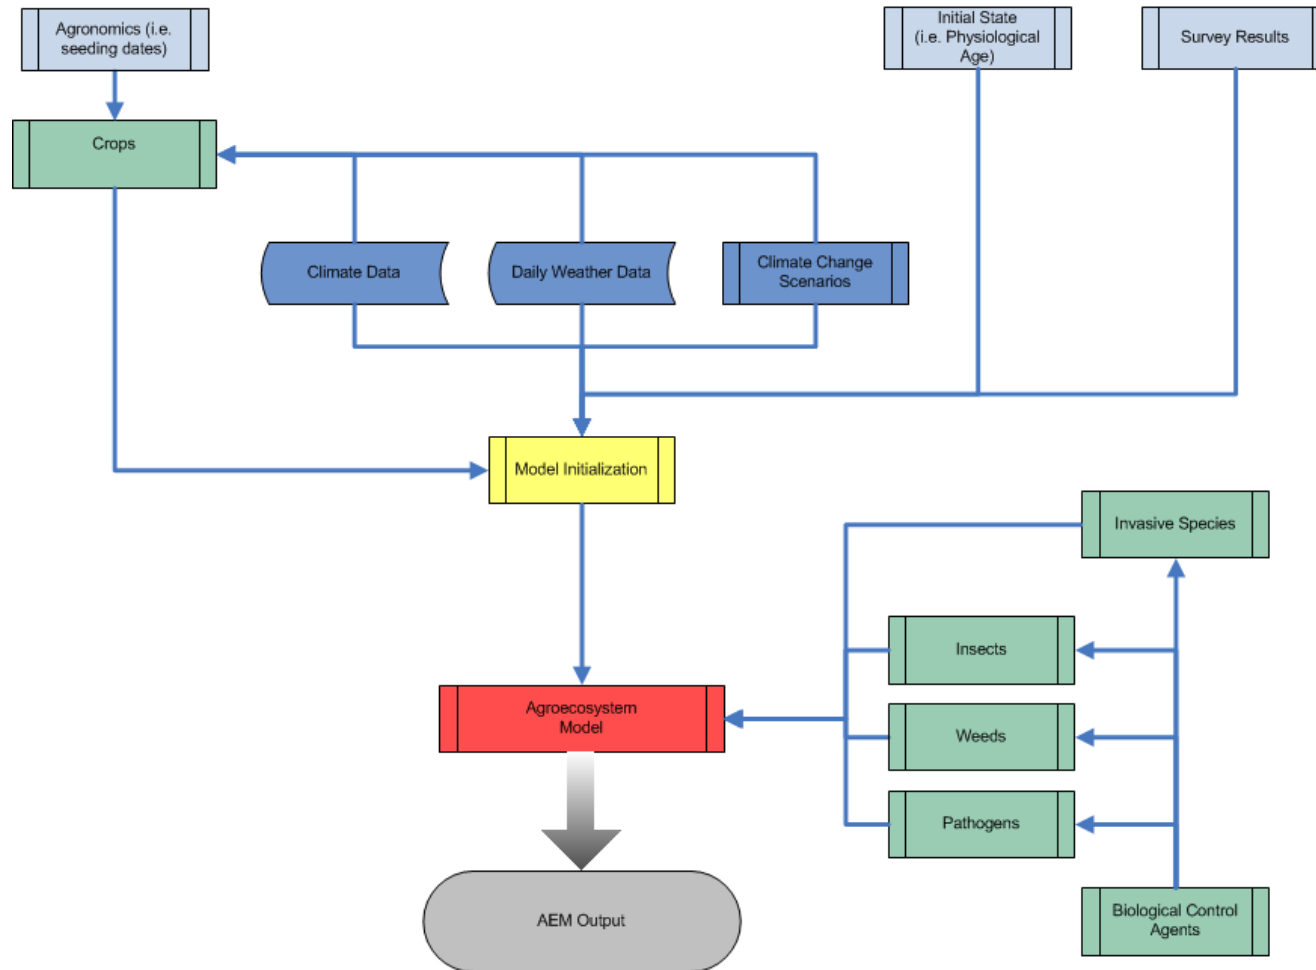

# Objectives

- Develop a framework to permit researchers to develop multiple species decision support systems.
- Quantify the changes in regional crop risk due to overlap of the three pest species across different time intervals.

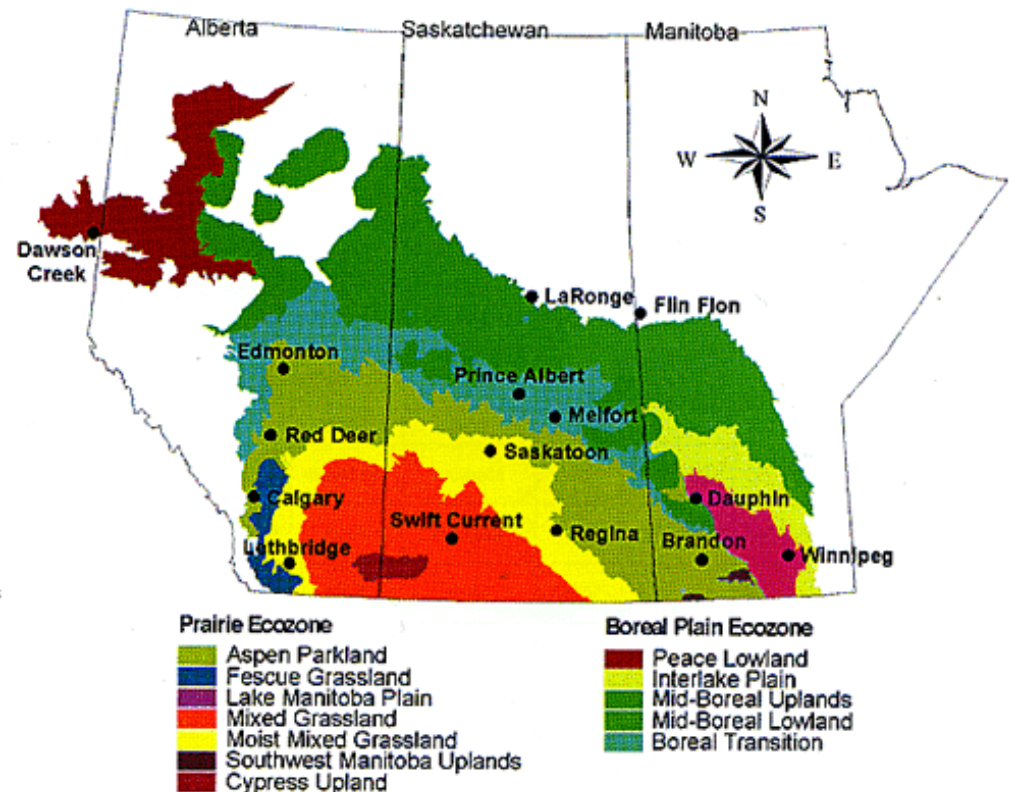

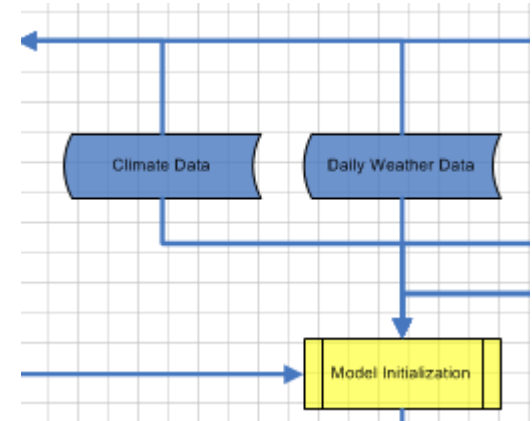

# Agroecosystem Model: AEM

## Agroecosystem Model: AEM

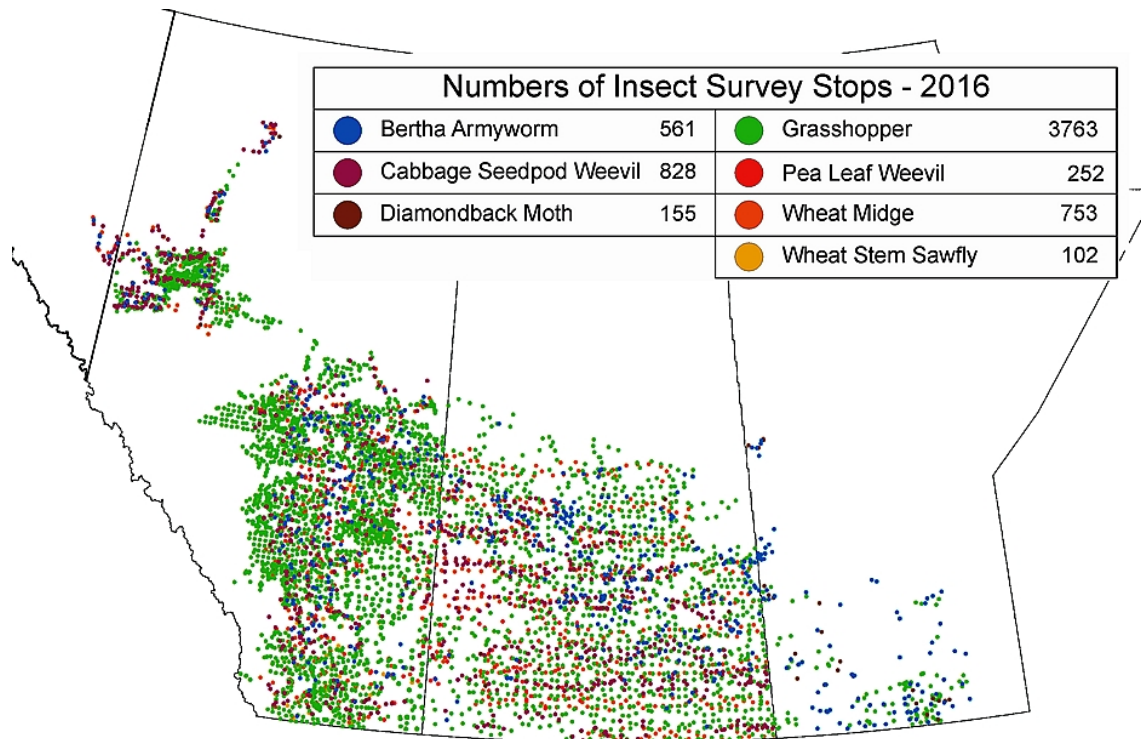

# Prairies ecozone

- Northern extension of Great Plains of North America.
- 95% of the region is farmland
- Semi-arid climate that is highly variable
  - Winters – Cold
  - Summers – Short and warm

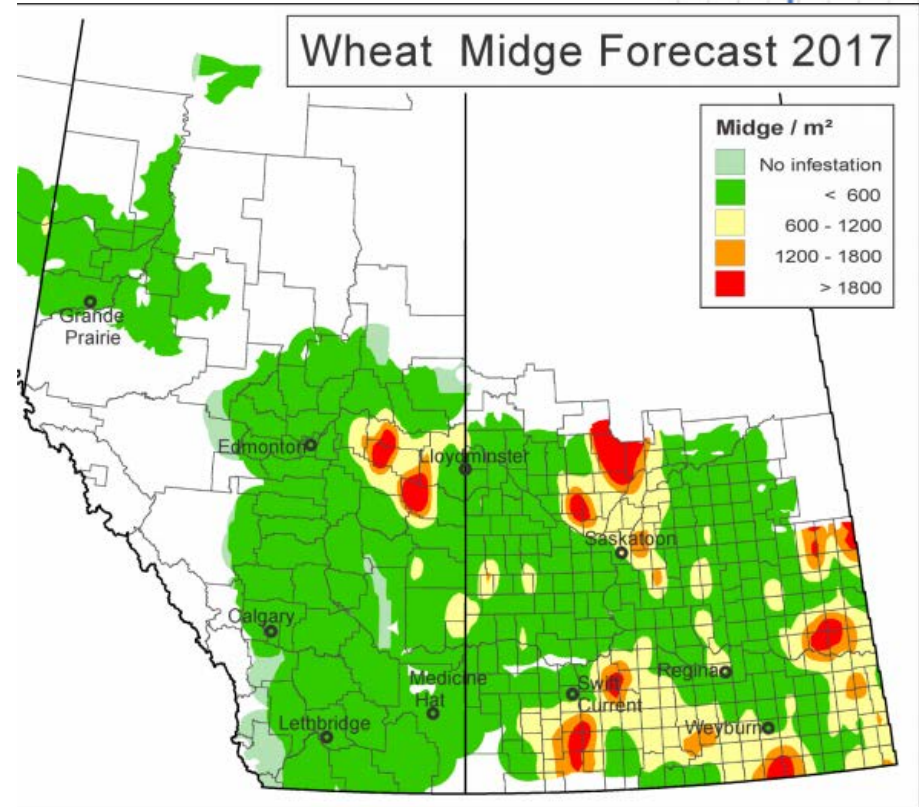

# Prairie insect surveys: PPMN

<http://prairiepestmonitoring.blogspot.ca/>

# Historical surveys: Forecasts

# Models

- Based on published bioclimatic models
- CLIMEX and DYMEX
- Climate/meteorological data
  - Daily – interpolated
  - Climate – CLIMOND (Kriticos et al. 2012)

# Bioclimatic model: Cereal Leaf Beetle (*Oulema melanopus*)

- Early season species. Adults and larvae are active in May and June.

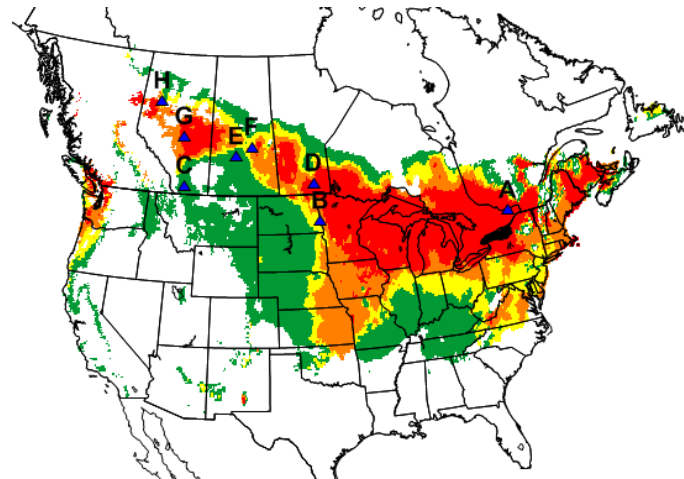

Olfert et. al. 2004. Canadian Entomologist **136**: 277-287.

# Bioclimatic model: Wheat midge (*Sitodiplosis mosellana*)

- Wheat midge – cool, wet (July)

# Bioclimatic model: Grasshoppers (*Melanoplus sanguinipes*)

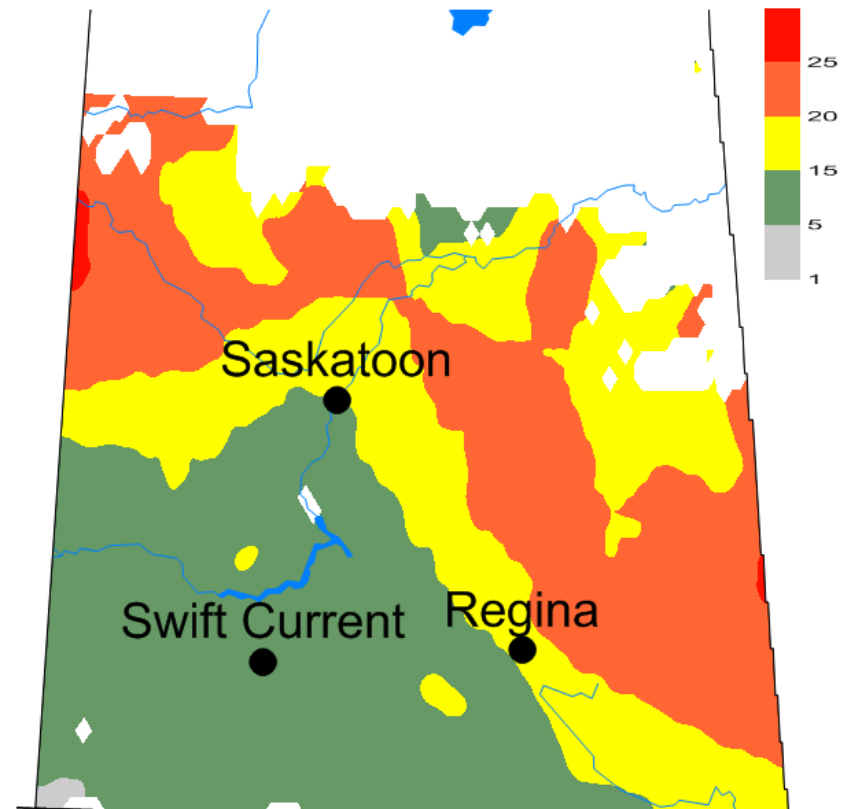

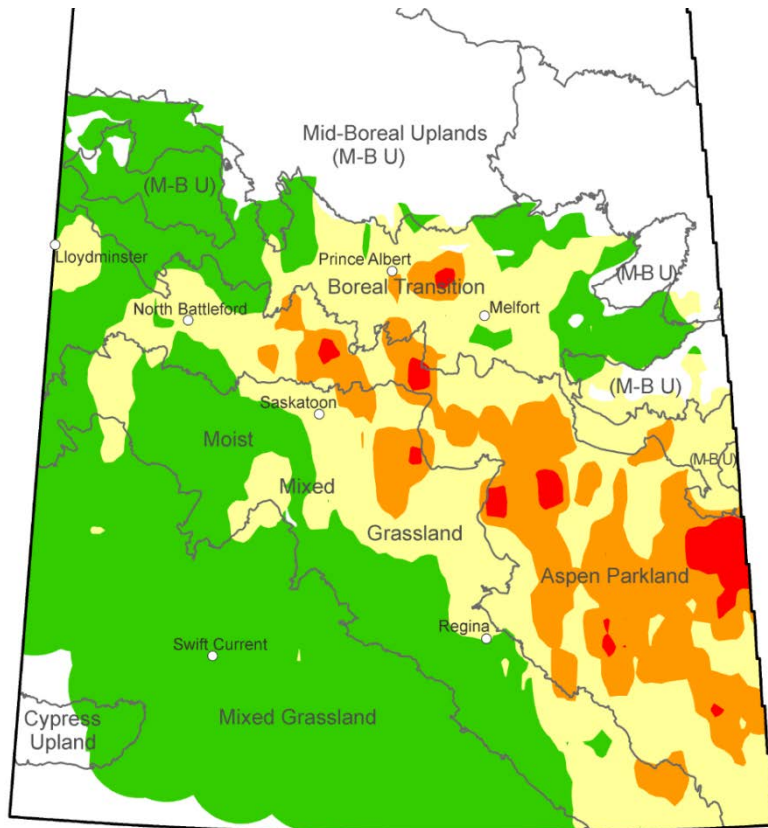

- Grasshoppers – hot, dry (May – September)

Olfert, O., Weiss, R.M. and Kriticos, D.J. 2011. Psyche **2011**: 1-9.

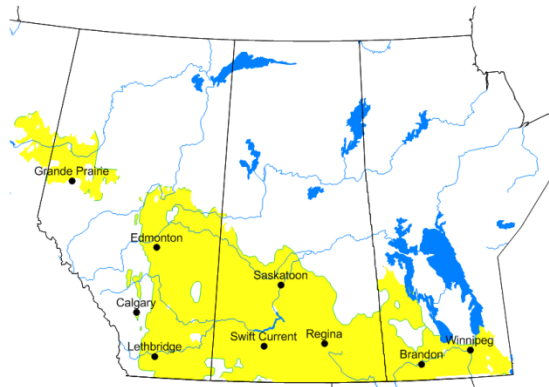

# Bridge the gap: Relate survey and model output

- Relate insect survey results and EI/GI values

# Current and Future Climate: Single vs Multiple species

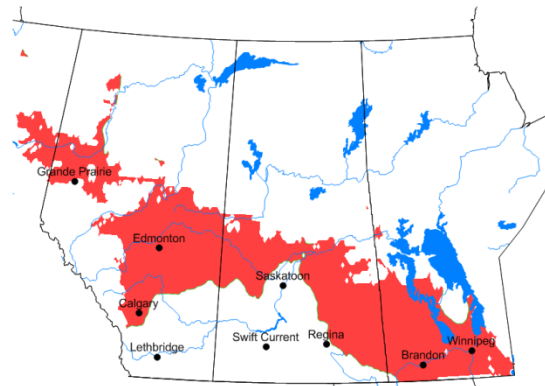

CLB - 1975

Msang - 1975

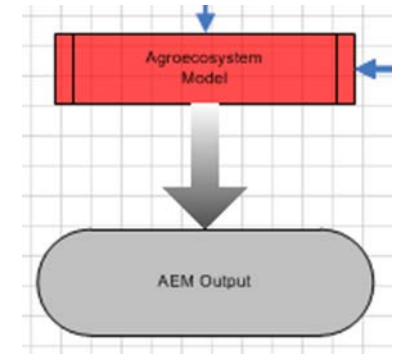

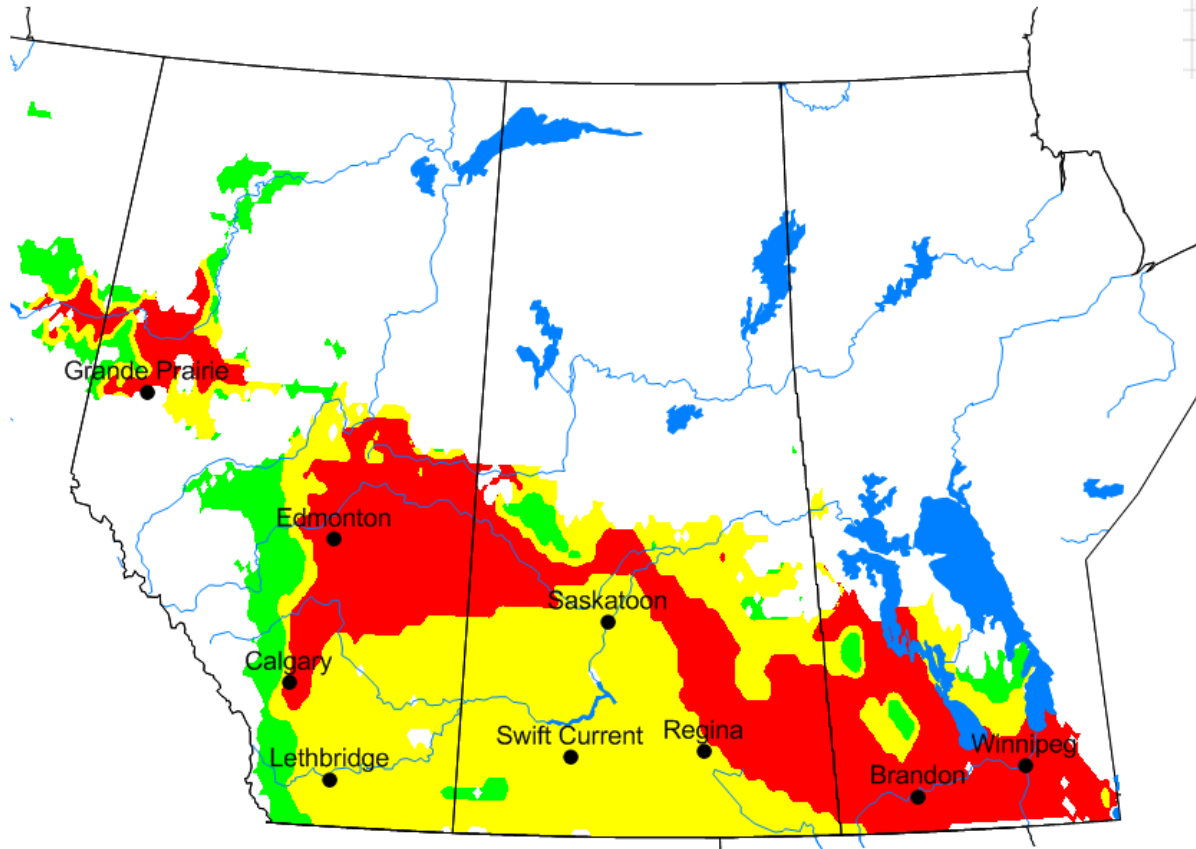

Wm - 1975

# Current climate

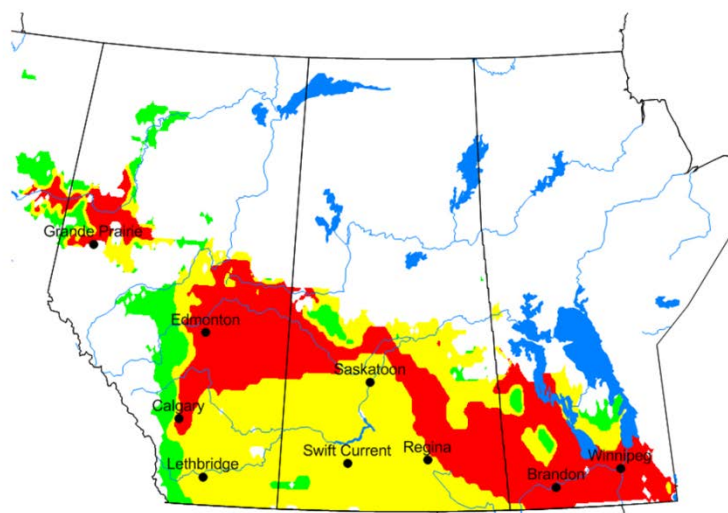

Mult species - 1975

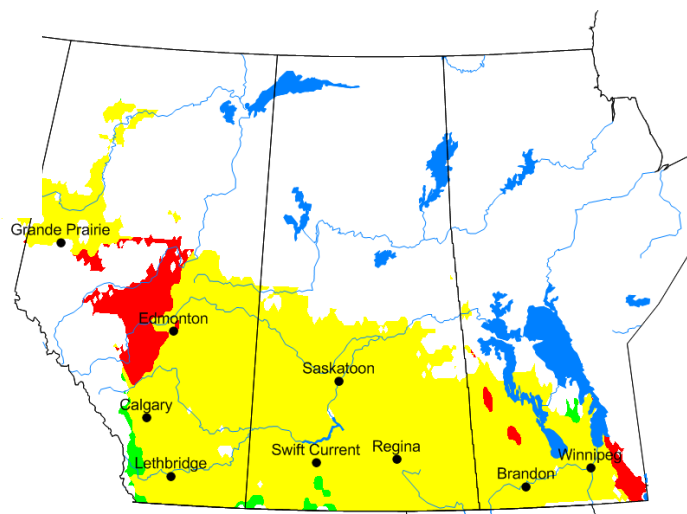

# Current Climate – Incremental Scenarios (+2C, -20%): Multiple species

Mult species - 1975

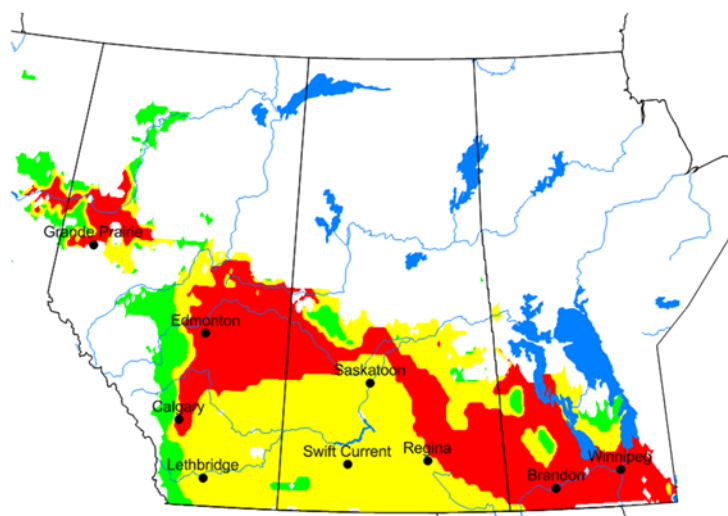

Mult species - 1975  
+2C, -20%

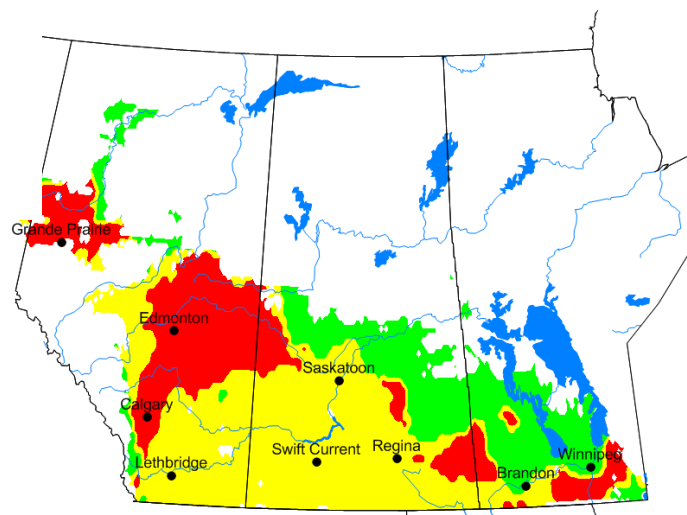

# Current Climate – Incremental Scenarios (-2C, +20%): Multiple species

Mult species - 1975

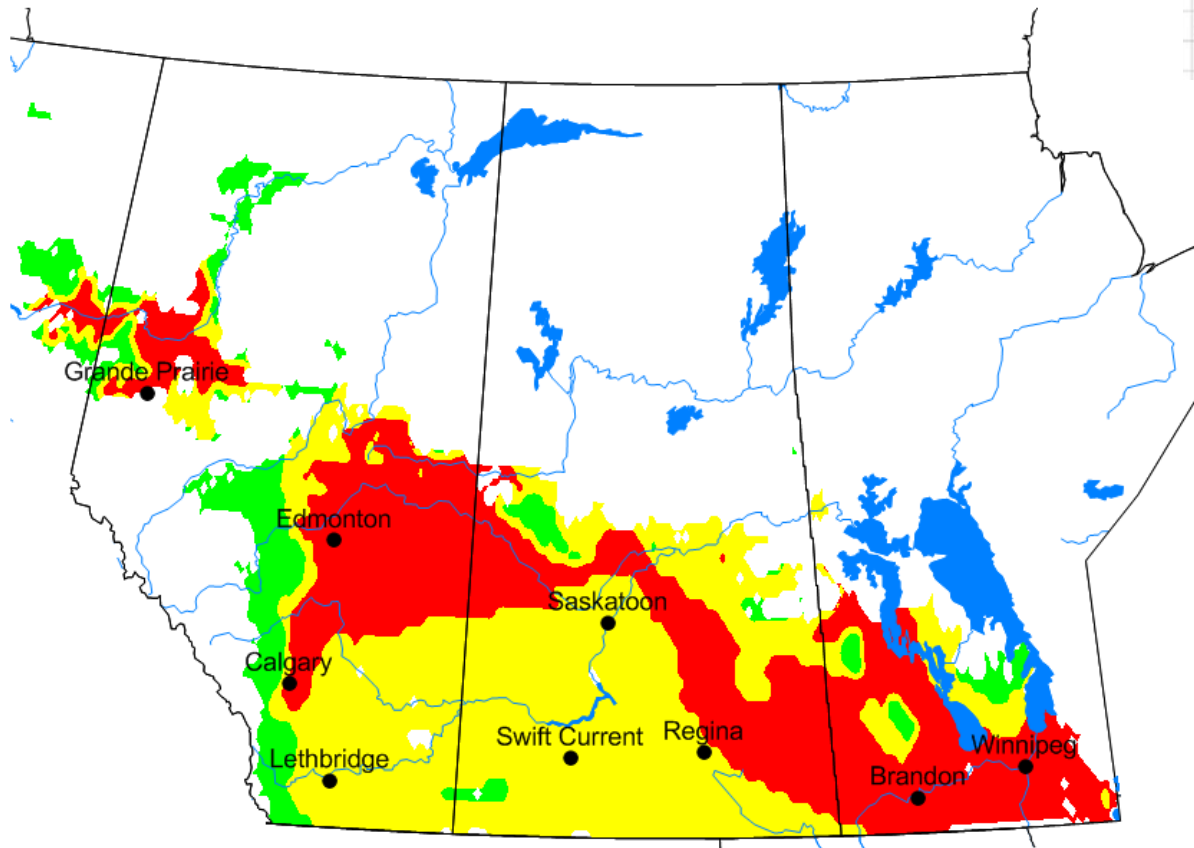

Mult species - 1975  
-2C, +20%

# Current climate

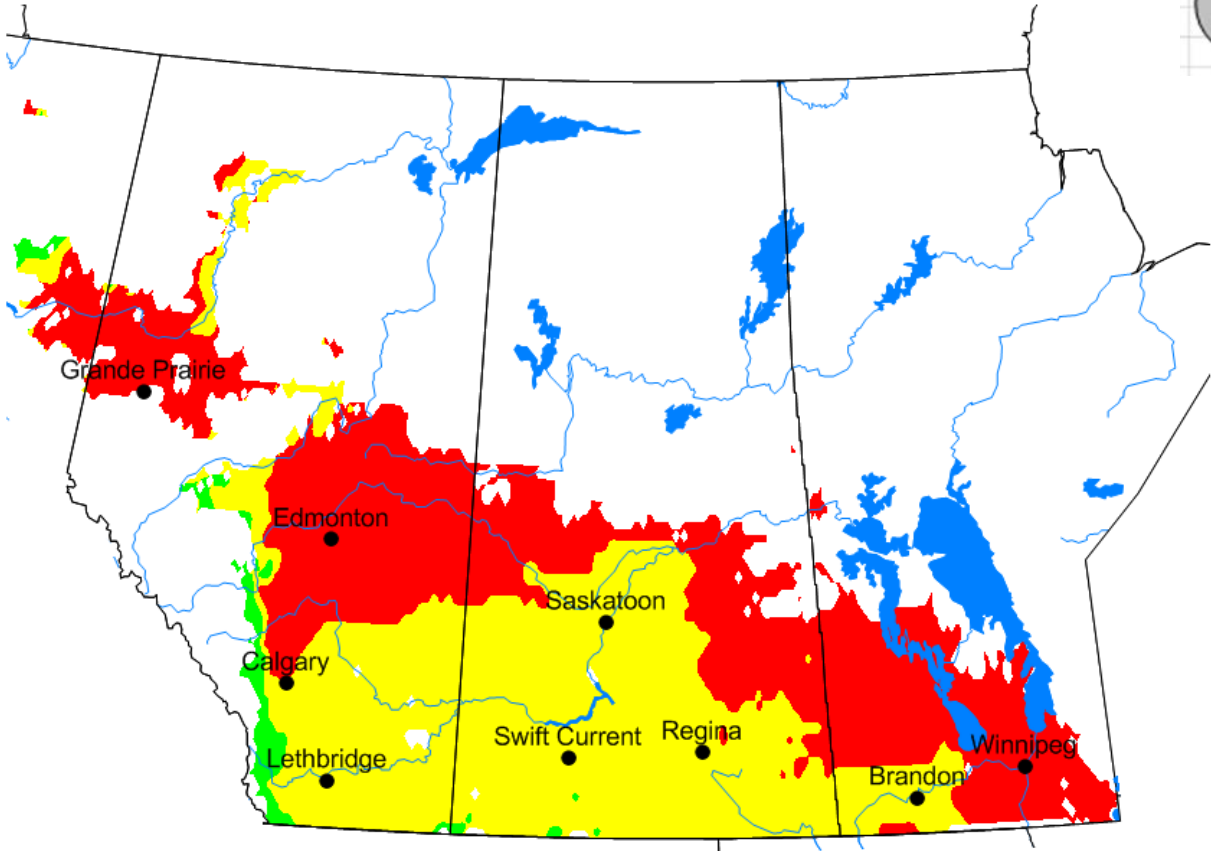

Mult species - 1975

Kriticos, D. J., et al. (2012). "CliMond: global high-resolution historical and future scenario climate surfaces for bioclimatic modelling." Methods in Ecology and Evolution **3**: 53-64.

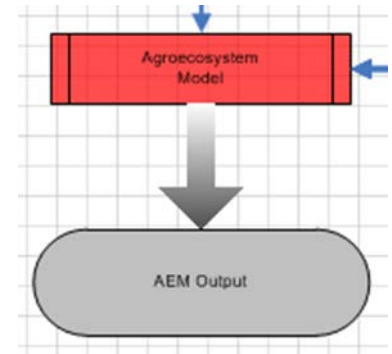

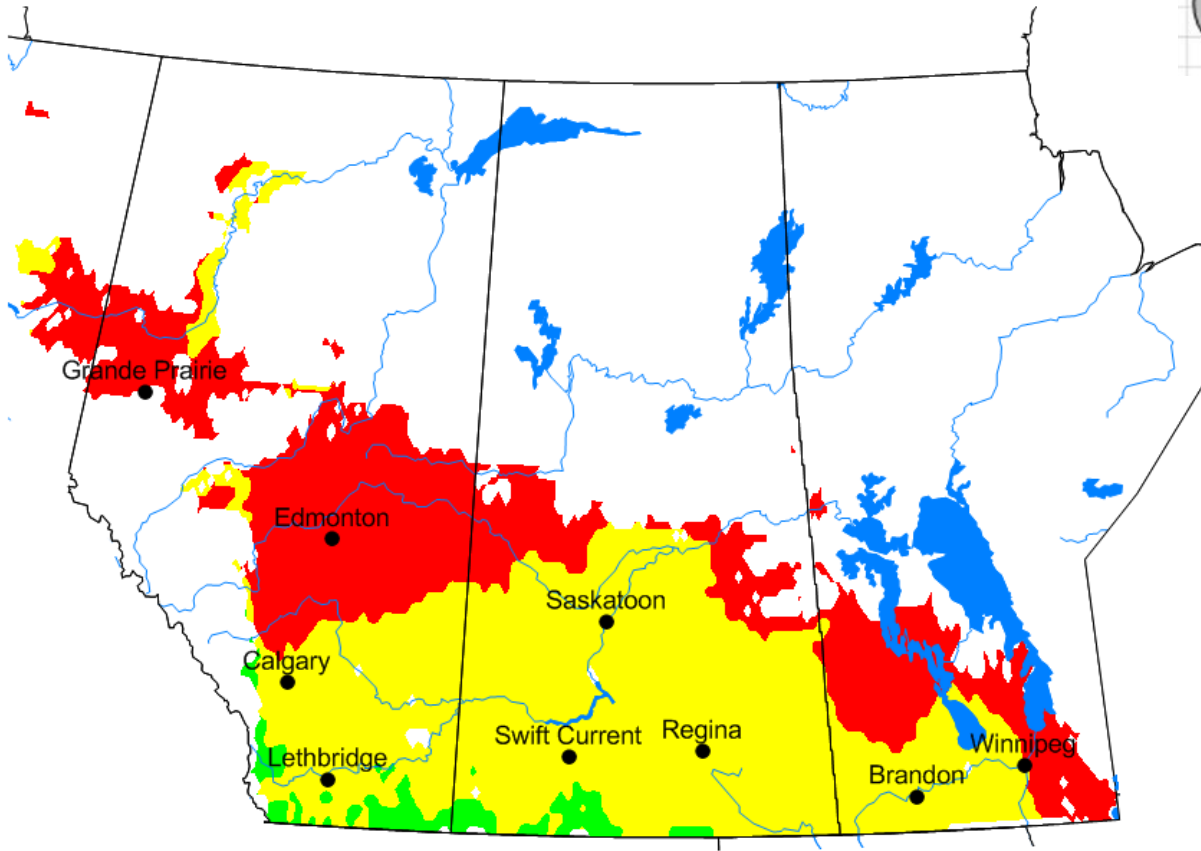

2030

Mult species - 2030

# 2070

Mult species - 2070

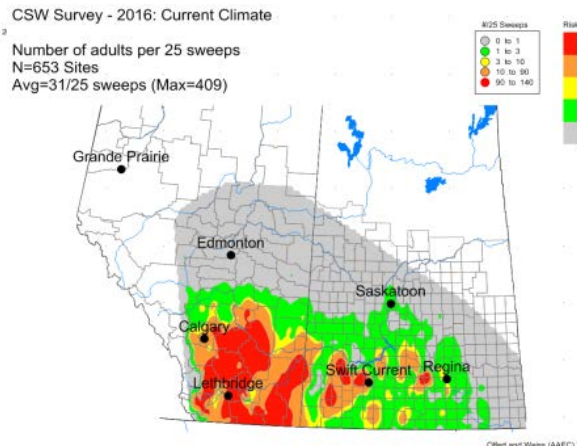

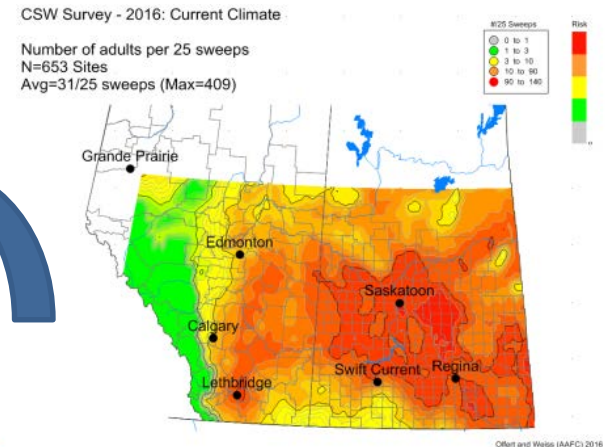

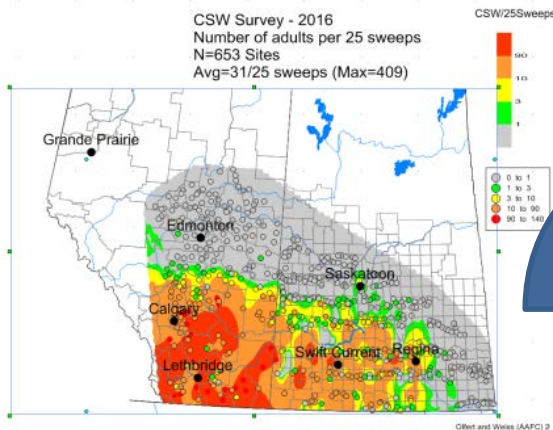

## Next steps...

- Integrate *survey data* with model output across multiple species including biocontrol agents and weeds.

# Next Steps: Surveys and climate risk estimates

- Survey data (2016) is combined with model output (GI values) to produce a composite surface that reflects the impact of climate on CSW populations (based on the survey from the previous year).

# Summary

- The AEM is a flexible, robust framework to address issues associated with pest risk analysis and decision support.
- Large scale field surveys can be a significant component of model initialization.
- Multiple species models identified geographic areas that are at risk for establishment of economic levels of pest population density.
- *Conduct similar studies to investigate response of natural enemies, weeds and pathogens.*

# Annual Forecasts: Temperature and rain scenarios

## Cool/Wet

CSW Survey - 2016: +40%, -1C

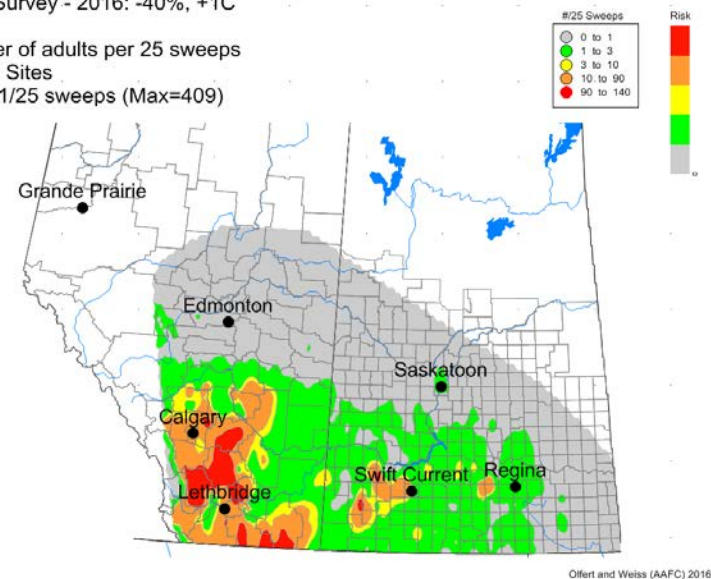

Number of adults per 25 sweeps  
N=653 Sites  
Avg=31/25 sweeps (Max=409)

## Warm/Dry

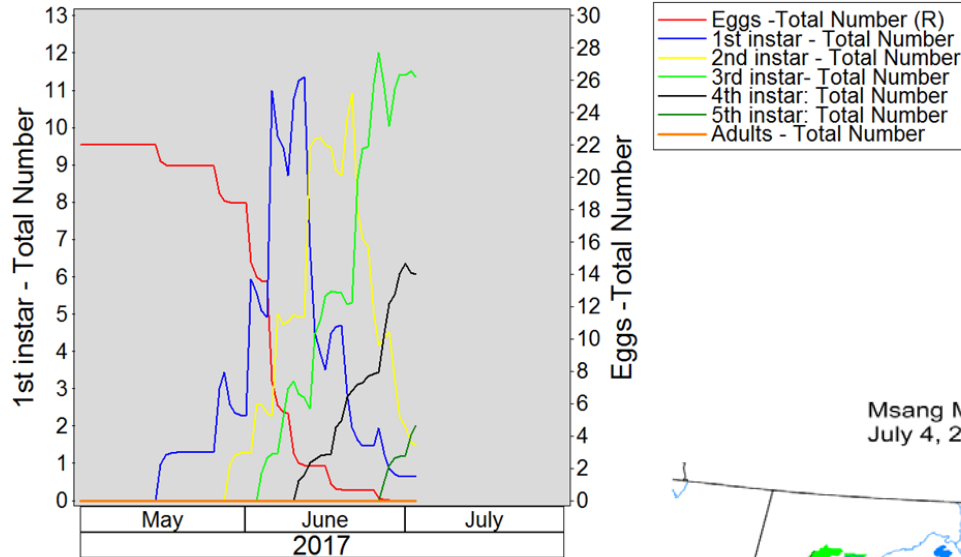

CSW Survey - 2016: -40%, +1C

Number of adults per 25 sweeps  
N=653 Sites  
Avg=31/25 sweeps (Max=409)

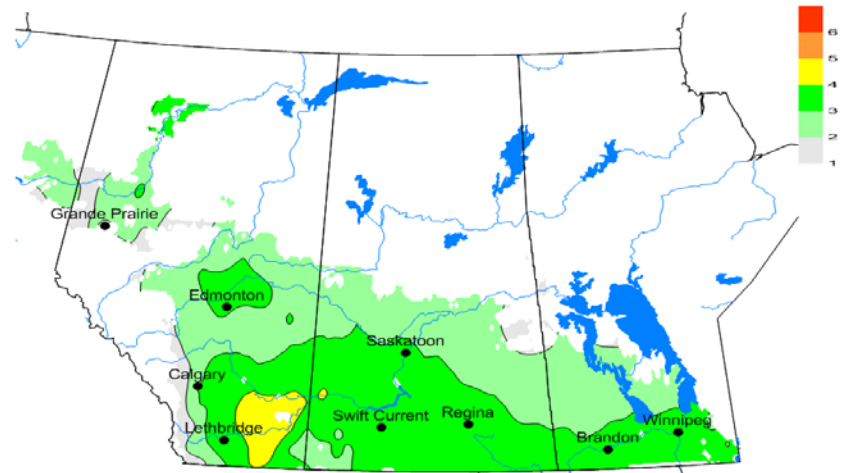

# Within growing season

*Msang - Saskatoon*

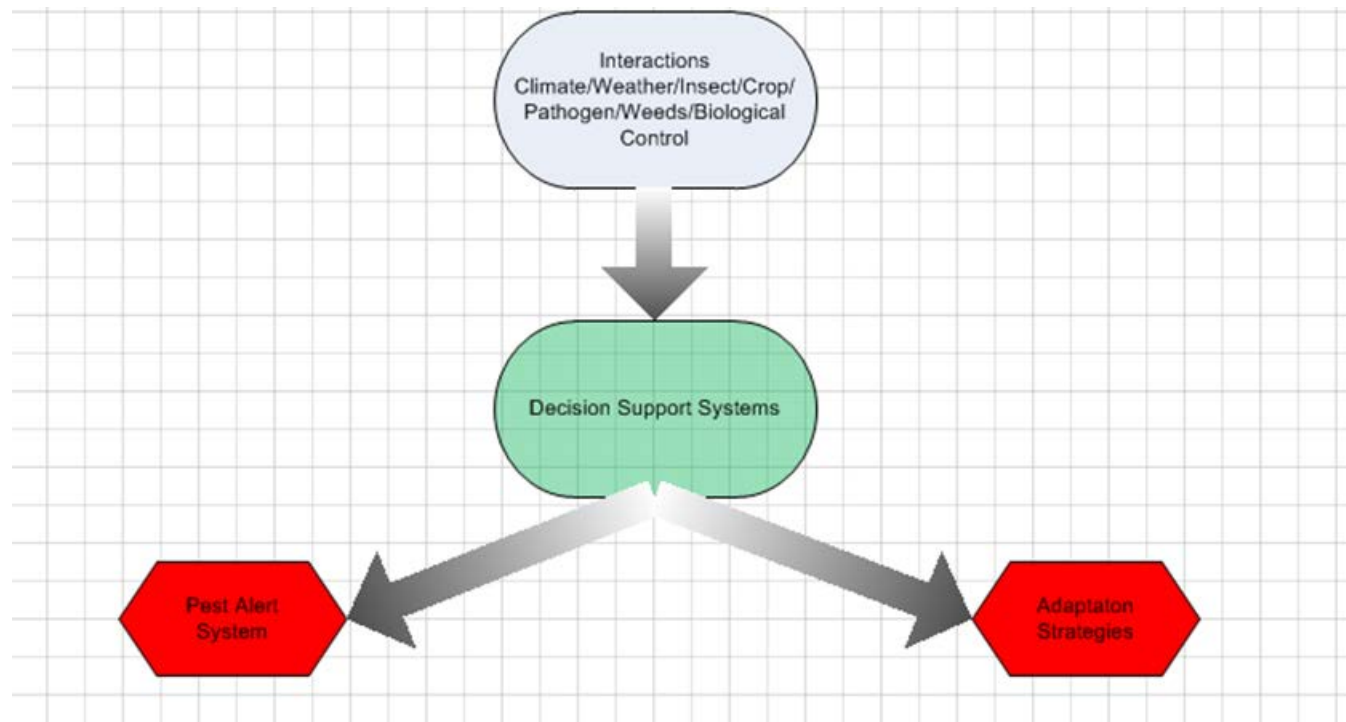

Msang Mean Instar  
July 4, 2017

# Raison d'être

Through increased awareness, farmers and land managers in potentially high-risk areas can be more proactive when needed, utilizing integrated pest management practices to combat the establishment or spread of pests.

# Bioclimatic model: Cereal Leaf Beetle (*Oulema melanopus*)

- Early season species. Adults and larvae are active in May and June.
